The Rise of AI-Generated Code is Here to Stay

Having tested tools like Gemini and ChatGPT, conducted research through various articles, and watched a conference on the topic, I can confidently say that the **quality of AI-generated UI still has some flaws**. However, with specific prior context and an iterative refinement process, more polished results can be achieved.

Nick Babich, in an interview (Babich & Doty, 2024), states that AI will not replace UX designers in the short term, as the quality of deliverables is not yet optimal. In the long term, the landscape could change, and by 2030, AI tools could surpass human work.

Here is where I want to make my point clear with all the information gathered: **AI should be considered another tool that complements the work of designers**. It will not replace anyone, but rather "force" an adaptation of its use in the workplace, which should not be a problem; let's not forget that **one of the main advantages it can offer is a huge saving in time and resources for carrying out simple or repetitive tasks**.
